Foreword

This standard defines the minimum requirements to be met in a forensic DNA analyst training program for the application of statistics to autosomal and Y-STR DNA profiling results. The aim is to provide a framework for quality training resulting in consistency within a laboratory and in the forensic DNA community.

The American Academy of Forensic Sciences established the Academy Standards Board (ASB) in 2015 with a vision of safeguarding Justice, Integrity and Fairness through Consensus Based American National Standards. To that end, the ASB develops consensus based forensic standards within a framework accredited by the American National Standards Institute (ANSI), and provides training to support those standards. ASB values integrity, scientific rigor, openness, due process, collaboration, excellence, diversity and inclusion. ASB is dedicated to developing and making freely accessible the highest quality documentary forensic science consensus Standards, Guidelines, Best Practices, and Technical Reports in a wide range of forensic science disciplines as a service to forensic practitioners and the legal system.

This document was revised, prepared, and finalized as a standard by the DNA Consensus Body of the AAFS Standards Board. The draft of this standard was developed by the Human Forensic Biology Subcommittee of the Organization of Scientific Area Committees (OSAC) for Forensic Science.

Questions, comments, and suggestions for the improvement of this document can be sent to AAFS-ASB Secretariat, asb@aafs.org or 410 N 21st Street, Colorado Springs, CO 80904.

All hyperlinks and web addresses shown in this document are current as of the publication date of this standard.

ASB procedures are publicly available, free of cost, at www.aafs.org/academy-standards-board.

Standard for Training in Statistical Calculations Used for 1 2 Forensic Short Tandem Repeat (STR) DNA Data 3 1 Scope 4 This standard provides the requirements for a forensic DNA laboratory's training program for the 5 use of statistical calculations and values reported for forensic autosomal and Y short tandem repeat 6 (STR) DNA data. 7 2 Normative References 8 The following reference is indispensable for the application of the standard. For dated references, 9 only the edition cited applies. For undated references, the latest edition of the referenced document 10 (including any amendments) applies. 11 ANSI/ASB Standard 022, Standard for Forensic DNA Analysis Training Programs¹. 12 3 Terms and Definitions 13 For purposes of this document, the following definitions apply. 14 3.1 15 **Combined Probability of Exclusion** 16 17 The probability that a randomly selected individual would be excluded as a contributor to the DNA 18 mixture. If the single-locus exclusion probabilities are independent, and if P_i is the probability of 19 exclusion at locus j, then the combined probability of exclusion is 1- \prod_i (1 - P_i). 20 3.2 21 **Combined Probability of Inclusion** 22 CPI 23 The probability that a randomly selected individual would not be excluded (i.e., is included) as a 24 contributor to the DNA mixture. If the single-locus exclusion probabilities are independent, and if P₁ 25 is the probability of exclusion at locus j, then the combined probability of inclusion is Π_i (1 - P_i). 26 3.3 27 counting method 28 A method for estimating genotype, sequence, or haplotype frequency by direct counting of the

populations for mitochondrial DNA and Y-STR DNA haplotype results.

29

30

31

number of times a genotype, sequence, or haplotype is observed in a database and dividing by the

number of samples in that database. This method is commonly used for estimating frequencies in

¹ Available from: <u>www.aafs.org/academy-standards-board</u>.

- 32 **3.4**
- 33 **haplotype**
- 34 A set of linked DNA variations, or polymorphisms, that tend to be inherited together (e.g.,
- 35 commonly used for human Y-chromosome or mitochondrial analysis). A haplotype can refer to a
- 36 combination of alleles or to a set of single nucleotide polymorphisms (SNPs) found along a single
- 37 chromosome that tend to be inherited together.
- 38 **3.5**
- 39 Hardy-Weinberg equilibrium
- 40 A state in which allele and single locus genotype frequencies do not change (on average) from one
- generation to the next in a population. When alleles in a population are independent, allele and
- 42 genotype frequencies are related through the Hardy-Weinberg principle: for a locus with 2 alleles P
- and Q at frequencies of p and q, homozygotes for P are found at frequency p², homozygotes for Q
- are found at a frequency of q², and heterozygotes are found at a frequency of 2pq. Use of the theta
- correction allows the assumption of Hardy-Weinberg equilibrium in the population for which a
- frequency database is constructed. See **theta correction**.
- 47 3.6
- 48 **Identical by Descent**
- 49 **IBD**
- Identical alleles that are copies of the same ancestral allele without mutation; this is a subset of
- identical by state (IBS).
- 52 **3.7**
- 53 **Identical by State**
- 54 **IBS**
- Identical alleles that may or may not be copies of the same ancestral allele.
- 56 **3.8**
- 57 **inbreeding**
- Mating of two persons who are more closely related than if they were chosen at random. It
- increases the frequency of homozygous genotypes above the expected for a randomly mating
- 60 population in Hardy-Weinberg equilibrium.
- **61 3.9**
- 62 kinship analysis
- 63 Comparison of genetic profiles of two or more individuals to evaluate alternative degrees of
- 64 biological relatedness.
- 65 **3.10**
- 66 Likelihood Ratio
- 67 LR
- A likelihood ratio is defined by a ratio of two conditional probabilities: the probabilities of the
- evidence given each of two mutually exclusive and competing propositions.
- 70 *ASTM E1732-12[mod]*²

² Available from ASTM, at <u>www.astm.org</u>

- 71 3.11
- 72 linkage equilibrium/disequilibrium
- When two or more genetic loci appear to segregate randomly in a given population, they are at
- equilibrium. When the loci do not segregate randomly, they are at disequilibrium.
- 75 **3.12**
- 76 mutation rate
- 77 The relative frequency at which mutations have been observed at a specific genetic locus; generally
- estimated as the number of mutations observed in parent-offspring pairs divided by the total
- 79 number of pairs examined.
- 80 3.13
- 81 Paternity or Maternity Index
- 82 PI/MI
- Likelihood ratio in which the numerator is the probability of the DNA data given the proposition
- 84 that the tested individual is the biological parent of the profile donor, and the denominator is the
- probability of the DNA data given the proposition that the tested individual is unrelated to the
- profile donor.
- 87 **3.14**
- 88 proposition
- A statement that is either true or false. In the context of evidence evaluation, propositions should
- be formulated in pairs: the paired propositions should be mutually exclusive (i.e., both cannot be
- orrect at the same time) and exhaustive in the context of the case (i.e., one should not consider all
- propositions as default, but only those that are thought to be of interest to the court).
- 93 3.15
- 94 Random Match Probability
- 95 **RMP**
- The probability of randomly selecting an unrelated individual from the population who could be a
- 97 potential contributor to an evidentiary profile.
- 98 **3.16**
- 99 reverse parentage
- Likelihood ratio in which three individuals have been profiled—the child and two questioned
- biological parents. More specifically, the probability of observing the data if the child is the
- biological child of the alleged parents, divided by the probability of observing the data if the tested
- individuals are unrelated to the child.
- 104 **3.17**
- sibship index
- Likelihood ratio in which the numerator is the probability of the DNA data given the proposition
- that the two tested individuals are biological siblings, and the denominator is the probability of the
- DNA data given the proposition that the two tested individuals are unrelated.
- 109 3.18
- source attribution
- 111 A declaration which identifies an individual as the source of the DNA that produced an evidentiary
- single-source or deduced contributor profile. This statement is based on a statistical estimate that
- meets or exceeds a laboratory-defined threshold.

- 114 3.19
- theta correction
- A method used to adjust statistical calculations that rely on population databases to correct for
- substructures within populations.
- 118 4 Requirements
- 119 **4.1** General
- ANSI/ASB Standard 022, Standard for Forensic DNA Analysis Training Programs shall be used in
- conjunction with this document because ANSI/ASB Standard 022 provides the foundational
- training program requirements upon which additional specific requirements, such as this
- document, will be based.
- The laboratory's training program shall include all requirements applicable to the work conducted
- by the laboratory and by the individual in training.
- 126 **4.2 Knowledge-Based Training**
- **4.2.1** At a minimum, the knowledge-based portion of the training program shall require review of
- the following:
- 129 a) the laboratory's protocols for statistical applications;
- b) the laboratory's applicable validation studies;
- 131 c) literature used to support validation;
- d) literature used to support specific calculations and their use in appropriate circumstances;
- e) applicable literature as assigned by the trainer;
- f) literature on the effects of cognitive bias in decision-making processes associated with
- statistical calculations used for forensic STR DNA data.
- 136 **4.2.2** The knowledge-based training component of the laboratory's training program shall
- provide the trainee with basic instruction of probability and statistics applied to autosomal and Y-
- 138 STR data to include, at minimum, the following topics.
- 139 a) Population Genetics
- 1) laws of Mendelian genetics (the law of segregation and the law of independent assortment);
- 141 2) Hardy-Weinberg equilibrium, assumptions, and related evolutionary forces;
- 142 3) linkage equilibrium/disequilibrium;
- 143 4) use of theta correction to adjust for inbreeding and population substructure.

144	b)	Statistical Foundations
145		1) frequency;
146		2) probability;
147		3) odds;
148		4) the laws of probability (e.g., the addition rule and product rule);
149		5) Bayes' theorem;
150		6) Sources of uncertainty (e.g., modelling uncertainty and sampling variability).
151	c)	Population Allelic Frequency Databases
152		1) population database size relative to the population size;
153		2) sample collection, to include:
154		i) number of samples,
155		ii) how population group was determined,
156		iii) how the database was created, maintained and reviewed,
157		iv) sampling uncertainty;
158		3) differences in allele frequencies observed between population databases;
159		4) mechanisms to account for alleles not observed in the database.
160	d)	Suitability of data for statistical application
161 162		1) when to perform statistical analyses and which statistical calculation is validated for the type of data obtained and comparison performed;
163 164		2) instruction on which loci to include in the statistical analyses when the following circumstances are observed, at a minimum:
165		i) no allelic data,
166		ii) partial allelic data,
167		iii) tri-alleles, duplications/triplications, null alleles, and mutations,
168		iv) STR artifacts.
169	e)	Statistical analysis for autosomal STR data
170		1) proper use of statistical calculations to include derivation and applicable equations;

171	2) statistical calculation method(s) in use by the laboratory, to address:
172	i) population substructure,
173	ii) mutation rates,
174	iii) known relatedness;
175	3) equation(s) in use by the laboratory, to include:
176	i) combined probability of inclusion,
177	ii) combined probability of exclusion,
178	iii) random match probability (or modification),
179	iv) likelihood ratio including formulating propositions;
180 181	4) operation of the software program(s) in use by the laboratory, including the underlying equations and review of the output data;
182	5) source attribution statements
183	6) limitations and assumptions of statistical method(s) used by the laboratory.
184	f) Statistical analysis for Y-STR data
184 185 186	 f) Statistical analysis for Y-STR data 1) detailed instruction on the calculation of haplotype frequencies using counting methods, to include:
185	1) detailed instruction on the calculation of haplotype frequencies using counting methods, to
185 186 187	1) detailed instruction on the calculation of haplotype frequencies using counting methods, to include:i) consideration of the differences between the loci that the database samples are typed
185 186 187 188	 detailed instruction on the calculation of haplotype frequencies using counting methods, to include: consideration of the differences between the loci that the database samples are typed with and the loci in the amplification kit used by the laboratory, instruction on confidence intervals, Y-STR profile probabilities and Y-STR match
185 186 187 188 189 190	 detailed instruction on the calculation of haplotype frequencies using counting methods, to include: consideration of the differences between the loci that the database samples are typed with and the loci in the amplification kit used by the laboratory, instruction on confidence intervals, Y-STR profile probabilities and Y-STR match probabilities,
185 186 187 188 189 190	 detailed instruction on the calculation of haplotype frequencies using counting methods, to include: consideration of the differences between the loci that the database samples are typed with and the loci in the amplification kit used by the laboratory, instruction on confidence intervals, Y-STR profile probabilities and Y-STR match probabilities, consideration of the effect of the database source/population and size;
185 186 187 188 189 190 191	 detailed instruction on the calculation of haplotype frequencies using counting methods, to include: consideration of the differences between the loci that the database samples are typed with and the loci in the amplification kit used by the laboratory, instruction on confidence intervals, Y-STR profile probabilities and Y-STR match probabilities, consideration of the effect of the database source/population and size; instruction on incorporating Y-STR mutation rates;
185 186 187 188 189 190 191 192 193	 detailed instruction on the calculation of haplotype frequencies using counting methods, to include: consideration of the differences between the loci that the database samples are typed with and the loci in the amplification kit used by the laboratory, instruction on confidence intervals, Y-STR profile probabilities and Y-STR match probabilities, consideration of the effect of the database source/population and size; instruction on incorporating Y-STR mutation rates; v) instruction on combining statistical values from autosomal and Y-STR data;
185 186 187 188 189 190 191 192 193 194	 detailed instruction on the calculation of haplotype frequencies using counting methods, to include: consideration of the differences between the loci that the database samples are typed with and the loci in the amplification kit used by the laboratory, instruction on confidence intervals, Y-STR profile probabilities and Y-STR match probabilities, consideration of the effect of the database source/population and size; instruction on incorporating Y-STR mutation rates; instruction on combining statistical values from autosomal and Y-STR data; operation of the software program(s) used by the laboratory, to include:

198 g) *Kinship analysis* 199 1) statistical calculations for kinship associations including derivation and use, to include, as 200 applicable: 201 i) the difference between alleles that are identical by state (IBS) or identical by descent 202 (IBD), 203 ii) how to set-up competing propositions for kinship calculations, 204 iii) how to account for mutations in the kinship calculations; 205 2) determination of appropriate calculation for the case (identifying the unknown in the 206 relationship scenario), to include: 207 i) maternity or paternity index, 208 ii) reverse parentage, 209 iii) sibship, aunt or uncle, or single grandparent index, 210 iv) complex family reconstruction. 211 4.3 Practical Training 212 **4.3.1** The practical component of the laboratory's training program shall provide the trainee with 213 practical instruction for the trainee to obtain the skills for calculating statistical values used by the 214 laboratory. 215 **4.3.2** At a minimum, the practical portion of the training program shall include the observation of 216 a trained analyst performing the processes with exercises representative of the range, type, and 217 complexity of DNA data from routine casework or database samples processed by the laboratory, at 218 least once or until clearly understood. 219 **4.3.3** Practical exercises shall be representative of the range, type, and complexity of routine DNA 220 data from casework samples processed by the laboratory. Practical exercises shall include the 221 following: 222 a) the application of statistical analysis to the laboratory's own data; 223 b) hand calculations for the following, as appropriate: RMP (or modification), single source LR, 224 CPI/CPE, and kinship analysis likelihood ratios; 225 c) exercises to understand the derivation of the equations involved in the calculation for 226 parentage and kinship analysis likelihood ratios, as appropriate.

4.3.4 The practical exercises performed shall be sufficient to demonstrate the trainee's ability to

follow the laboratory's protocols and produce accurate statistical values.

227

228

229	4.4 Competency Component
230	4.4.1 General
231 232 233 234	The competency component of the laboratory's training program shall demonstrate knowledge-based and practical competency in the laboratory's protocols for statistical applications. The format of the test(s) and the criteria for passing the competency test(s) shall meet Section 4.3 of the ANSI/ASB Standard 022, Standard for Forensic Training DNA Analysis Training Programs.
235	4.4.2 Knowledge-Based Competency
236 237 238 239 240	As applicable to the trainee's job responsibilities, the trainee shall successfully complete (as defined by the laboratory's policy) a knowledge-based test covering the critical information obtained during the training on case record management, forensic DNA report writing, and performing technical and administrative reviews. The test(s) shall cover, at a minimum, the topics outlined in 4.2 and its subsections.
241	4.4.3 Practical Competency
242 243 244 245 246	The trainee shall successfully complete (as defined by the laboratory's policy) a practical competency test covering each of the statistical applications the trainee will be independently authorized to perform. DNA data from samples representative of the range, type, and complexity for which the trainee will be authorized to perform statistical calculations shall be included in the practical competency test(s).
247	5 Conformance
248 249 250	In order to demonstrate conformance with this standard, the laboratory shall meet the requirements outlined in Section 5 of ANSI/ASB Std 022, Standard for Forensic DNA Analysis Training Programs and all the requirements set forth in this document.
251
