## Foreword

This document provides requirements for a laboratory conducting (or planning to conduct) familial DNA searching to identify a potential biological relative of an unknown individual whose DNA has been found at a crime scene or in a forensic investigation. This standard also establishes requirements for safeguarding individual privacy and the confidentiality of familial DNA search results. Familial searching may be used in criminal investigations, missing persons cases, and cold cases after other investigative leads have been exhausted. It involves the use of STR-based likelihood ratio calculations to develop a candidate list of potential familial relationships between the unknown contributor of the evidence DNA sample and individuals in a DNA database. This document is designed to outline the procedures and requirements for familial DNA searching, without focusing on the source DNA testing or any additional confirmatory steps that may be necessary. Requirements for generating the initial searchable DNA profile and any confirmatory additional testing can be found in other published ANSI/ASB standards and the FBI Quality Assurance Standards for Forensic DNA Laboratories.

The American Academy of Forensic Sciences established the Academy Standards Board (ASB) in 2015 with a vision of safeguarding Justice, Integrity, and Fairness through Consensus Based American National Standards. To that end, the ASB develops consensus based forensic standards within a framework accredited by the American National Standards Institute (ANSI), and provides training to support those standards. ASB values integrity, scientific rigor, openness, due process, collaboration, excellence, diversity and inclusion. ASB is dedicated to developing and making freely accessible the highest quality documentary forensic science consensus Standards, Guidelines, Best Practices, and Technical Reports in a wide range of forensic science disciplines as a service to forensic practitioners and the legal system.

This document was revised, prepared, and finalized as a standard by the DNA Consensus Body of the AAFS Standards Board. The draft of this standard was developed by the Human Forensic Biology Subcommittee of the Organization of Scientific Area Committees (OSAC) for Forensic Science.

Questions, comments, and suggestions for the improvement of this document can be sent to AAFS-ASB Secretariat, [asb@aafs.org](mailto:asb@aafs.org) or 410 N 21st Street, Colorado Springs, CO 80904.

All hyperlinks and web addresses shown in this document are current as of the publication date of this standard.

ASB procedures are publicly available, free of cost, at [www.aafs.org/academy-standards-board](http://www.aafs.org/academy-standards-board).

DRAFT

# Standard for Familial DNA Searching

## 1 Scope

This standard requires laboratories that perform familial DNA searches (searching laboratories) to have a policy specifying criteria for:

- a) accepting a familial DNA search request;
- b) administrative structure and responsibilities;
- c) the search process;
- d) reporting results;
- e) safeguarding individual privacy and confidentiality of the familial DNA search results; and

training of an individual evaluating familial search results. This standard also defines validation requirements for familial DNA searches.

This standard does not apply to Forensic Investigative Genetic Genealogy or to the investigation of partial matches that may occur during the normal course of forensic database searches.

## 2 Normative References

The document contains no normative references. Annex A, Bibliography, contains informative references.

## 3 Terms and Definitions

For purposes of this document, the following definitions apply.

### 3.1

#### **familial DNA search**

#### **familial DNA searching**

A deliberate search of an offender DNA database [e.g. Combined DNA Index System (CODIS)] using software to detect and statistically rank a list of potential candidates whose DNA profiles are in the database and who could be close biological relatives (e.g., parent, child, sibling) of the unknown individual contributing the evidence DNA profile.

### 3.2

#### **likelihood ratio**

#### **LR**

The probability of the evidence under one proposition (hypothesis), divided by the probability of the evidence under an alternative, mutually exclusive proposition (hypothesis). The magnitude of its value expresses the weight of the evidence relative to the propositions (hypotheses).

**32 3.3****33 likelihood ratio threshold**

34 The likelihood ratio below which a database profile specific to the relationship(s) under  
35 consideration would not be further investigated.

**36 3.4****37 lineage testing**

38 Genetic testing, such as Y-STR, X-STR, or mitochondrial DNA analysis, used to trace maternal or  
39 paternal inheritance.

**40 3.5****41 ranking threshold**

42 The rank below which a database profile specific to the relationship(s) under consideration would  
43 not be further investigated.

44 NOTE For example, a laboratory may decide to investigate only a set number of the best ranked candidates  
45 regardless of the likelihood ratio.

**46 3.6****47 searching laboratory**

48 A laboratory that performs familial DNA searches.

**49 3.7****50 sensitivity study**

51 A validation assessment used to determine the proportion of familial searches within the test that  
52 detect true relatives of the evidence profile's known contributor at each ranking threshold.

**53 3.8****54 source testing laboratory**

55 An accredited laboratory that performs DNA testing on forensic evidence samples that are  
56 submitted for familial DNA searching and has ownership of the DNA data.

**57 3.9****58 specificity study**

59 A validation assessment used to determine the proportion of familial searches within the test that  
60 exclude true non-relatives of the evidence profile's known contributor.

61 NOTE Practical limitations can restrict this study to the initial statistical comparisons of simulated forensic  
62 unknowns to DNA database profiles.

**63 4 Requirements****64 4.1 Policy and Procedure**

65 **4.1.1** The searching laboratory shall have documented policies and/or procedures ("the  
66 document") for conducting familial DNA searching that contains the information detailed in 4.1.2  
67 through 4.1.12, as applicable to the laboratory's involvement in the elements described in each  
68 substandard. To aid the public and law enforcement in understanding the laboratory's familial  
69 search results, the document shall be publicly available.

70 **4.1.2** The document shall define the process for case submission and acceptance for conducting  
71 DNA familial searching. The following shall be considered in the case acceptance policy:

- 72 a) seriousness or seriality of the crime;
- 73 b) commitment to proceed with investigation and prosecution;
- 74 c) case metadata and source testing laboratory notes;
- 75 d) investigative stage to initiate a familial search, such as, when other apparently viable  
76 investigative strategies have been exhausted;
- 77 e) the availability of additional DNA evidence; and
- 78 f) out of state search requests.

79 **4.1.3** The document shall define the roles of the individuals involved in the DNA familial search  
80 process and oversight. An individual can fill more than one role. The familial DNA search process  
81 may involve individuals in the following roles:

- 82 a) a review committee (to evaluate requests, prioritize testing, verify results, and determine the  
83 propriety of moving forward with an investigation or disclosure of a name);
- 84 b) an individual or committee who has the ultimate control for the search and directs the release  
85 of investigative lead(s) and any follow-up;
- 86 c) an administrative representative from the source testing laboratory;
- 87 d) an administrative representative from the searching laboratory;
- 88 e) a technical representative from the source testing laboratory;
- 89 f) a technical representative from the searching laboratory;
- 90 g) a representative with access to investigative databases (metadata) typically restricted to law  
91 enforcement personnel;
- 92 h) a representative from the requesting law enforcement agency;
- 93 i) a representative from the prosecuting agency; and
- 94 j) a representative of the defendant when the search is being performed at the request of the  
95 defense.

96 **4.1.4** The document shall define how information obtained through the familial search process is  
97 shared and released, and shall include:

- 98 a) safeguards for the disclosure of sensitive information; and
- 99 b) provisions protecting the privacy of possible family members in the search database who could  
100 not be the perpetrator.

101 **4.1.5** The document shall ensure that all the individuals with roles established in 4.1.3 are  
102 informed of the process, potential outcomes, limitations, and the need for additional investigation,  
103 including source testing laboratory policies and procedures for acceptance, testing, and comparison  
104 of possible confirmatory samples. This could be achieved through the use of a documented  
105 memorandum of understanding or equivalent.

106 **4.1.6** The document shall define the acceptance requirements of the evidence profile to be  
107 searched to include the following:

- 108 a) the DNA sample was directly associated with the crime scene/crime and is attributed to the  
109 putative perpetrator;
- 110 b) the minimum threshold for the number of searchable loci and/or profile rarity;
- 111 c) the acceptable level of potential allelic dropout in the profile submitted for the familial DNA  
112 search;
- 113 d) the number of possible contributors, e.g., single source, deduced single source from a mixture,  
114 or mixtures up to a defined maximum number of contributors; and
- 115 e) a requirement that a direct comparison search of the profile has occurred in relevant databases  
116 (e.g., CODIS) prior to the familial DNA search being conducted.

117 **4.1.7** The document shall define which database categories will be searched (e.g., convicted  
118 offenders index).

119 **4.1.8** The document shall define which relationships (e.g., 1<sup>st</sup> degree relatives only) will be  
120 considered.

121 **4.1.9** The document shall define situations where additional testing, such as expanded  
122 autosomal STR (beyond the original 13 CODIS core loci) and/or lineage testing (e.g., Y-STR, X-STRs  
123 and/or mitochondrial DNA) of potential relatives), is required.

124 **4.1.10** The document shall define the thresholds (e.g., likelihood ratio and ranking) for proceeding  
125 with the release of information regarding potential relatives.

126 **4.1.11** The document shall define the reporting criteria for the release of the name(s) of the  
127 potential relative(s) and the type of information, including limitations of the results, in the  
128 notification.

129 NOTE Limitations may include, but are not limited to, the following: 1) the named offender is not the source  
130 of the forensic unknown DNA profile from the specimen, 2) the results do not confirm that the named  
131 individual is in fact biologically related to the source of the unknown profile, and 3) the DNA results could be  
132 explained by familial relationships other than those provided in the results.

133 **4.1.12** The following criteria shall be considered prior to the reporting of the name(s) of the  
134 potential relative(s):

- 135 a) the use of metadata for the evaluation of a potential relative, and

136 b) assessing kinship using non-invasive investigation (i.e., one that does not require direct contact  
137 with a person of interest).

## 138 4.2 Technical

139 4.2.1 The searching laboratory shall use internally validated analytical procedures/systems and  
140 software.

141 4.2.2 Internal validation shall include sensitivity and specificity studies to include the range of  
142 search profiles defined in 4.1.6 b), 4.1.6 c), and 4.1.6 d).

143 NOTE A reasonable sensitivity test will seed a database of unrelated individuals with the profiles of true  
144 relatives, at a minimum, those defined in section 4.1.8, of the experimental search profile. Ranking the LRs for  
145 all comparisons from highest to lowest, sensitivity is defined as the proportion of true relatives, real or in  
146 silico, included at each ranking threshold. Alternatively, the ranked list of unrelated individuals' LRs can be  
147 seeded with the LRs for each of the true family members, thus avoiding the insertion of experimental profiles  
148 into the database.

149 NOTE A reasonable specificity test will examine how many unrelated individuals remain as candidates after  
150 the statistical process (e.g., the initial LR rankings based solely upon autosomal STR loci). Coupled with how  
151 many of those individuals meet the requirements to be tested with additional laboratory work will give an  
152 estimate of how likely it will be to see a false positive. Knowing whether the statistical process the searching  
153 laboratory has put in place will lead to tens of candidates, hundreds of candidates, or thousands of candidates  
154 will give a sense of whether the subsequent lineage testing, or additional autosomal markers, might  
155 adventitiously include a non-relative.

156 4.2.3 The searching laboratory shall determine if the sensitivity and specificity studies will  
157 incorporate the following:

- 158 a) population substructure ( $F_{st}$  or  $\theta$ );
- 159 b) mutation model;
- 160 c) silent (null) allele model;
- 161 d) correction for linkage;
- 162 e) probabilistic genotyping; and
- 163 f) prior odds/probability.

164 4.2.4 Search criteria developed from sensitivity and specificity studies shall be established to err  
165 on the side of minimizing false positives.

166 NOTE Search criteria developed from sensitivity and specificity studies can be impacted by the capacity and  
167 resources of the searching laboratory in addition to the size of the database being searched.

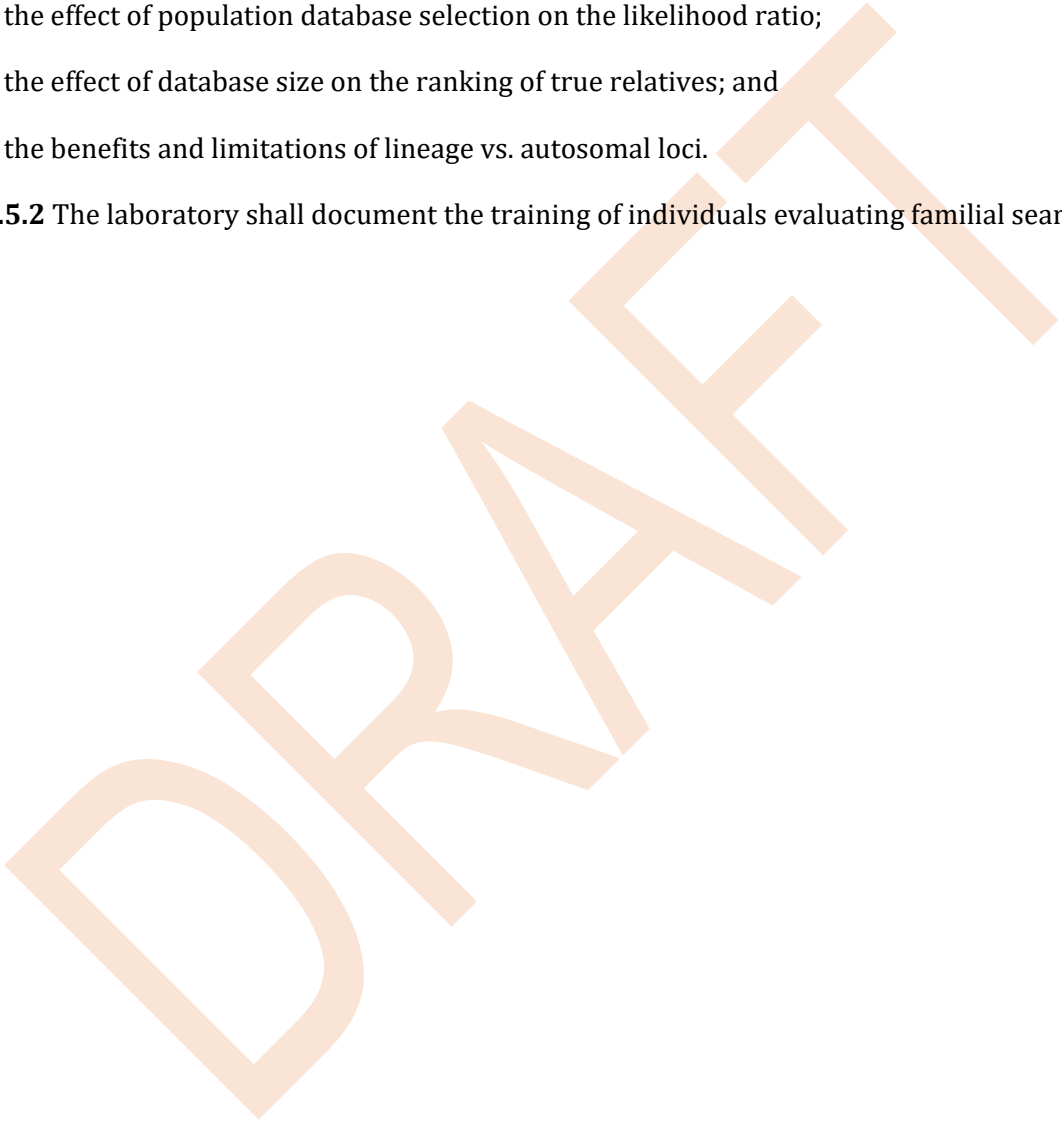

168 4.2.4.1 The searching laboratory shall have a documented training program specific to familial DNA  
169 searching. The training program shall include the following concepts:

- 170 a) the expected levels of DNA sharing for various relationships, including the flow of DNA through  
171 pedigrees and lineage vs. autosomal patterns of inheritance;

- 172 b) the calculations performed in familial searching, including likelihood ratios and conditional  
173 probabilities given an assumed level of relatedness;
- 174 c) likelihood ratio distributions for various relationship categories;
- 175 d) evaluating pedigrees larger than two-person comparisons;
- 176 e) addressing the issues of linked loci and meiotic mutations;
- 177 f) the effect of population database selection on the likelihood ratio;
- 178 g) the effect of database size on the ranking of true relatives; and
- 179 h) the benefits and limitations of lineage vs. autosomal loci.

180 **4.2.5.2** The laboratory shall document the training of individuals evaluating familial search results.
